

Quora Question Pairs

1. Business Problem

1.1 Description

Quora is a place to gain and share knowledge—about anything. It's a platform to ask questions and connect with people who contribute unique insights and quality answers. This empowers people to learn from each other and to better understand the world.

Over 100 million people visit Quora every month, so it's no surprise that many people ask similarly worded questions. Multiple questions with the same intent can cause seekers to spend more time finding the best answer to their question, and make writers feel they need to answer multiple versions of the same question. Quora values canonical questions because they provide a better experience to active seekers and writers, and offer more value to both of these groups in the long term.

- > Credits: Kaggle

 __ Problem Statement ___
- Identify which questions asked on Quora are duplicates of questions that have already been asked.
- · This could be useful to instantly provide answers to questions that have already been answered.
- We are tasked with predicting whether a pair of questions are duplicates or not.

1.3 Real world/Business Objectives and Constraints

- 1. The cost of a mis-classification can be very high.
- 2. You would want a probability of a pair of questions to be duplicates so that you can choose any threshold of choice.
- 3. No strict latency concerns.
- 4. Interpretability is partially important.

2. Machine Learning Probelm

2.1 Data

2.1.1 Data Overview

- Data will be in a file Train.csv
- Train.csv contains 5 columns : qid1, qid2, question1, question2, is duplicate
- Size of Train.csv 60MB
- Number of rows in Train.csv = 404,290

2.1.2 Example Data point

```
"id","qid1","qid2","question1","question2","is_duplicate"

"0","1","2","What is the step by step guide to invest in share market in india?","What is the step by step guide to invest in share marke t?","0"

"1","3","4","What is the story of Kohinoor (Koh-i-Noor) Diamond?","What would happen if the Indian government stole the Kohinoor (Koh-i-Noor) diamond back?","0"

"7","15","16","How can I be a good geologist?","What should I do to be a great geologist?","1"

"11","23","24","How do I read and find my YouTube comments?","How can I see all my Youtube comments?","1"
```

2.2 Mapping the real world problem to an ML problem

2.2.1 Type of Machine Leaning Problem

It is a binary classification problem, for a given pair of questions we need to predict if they are duplicate or not.

2.2.2 Performance Metric

Source: https://www.kaggle.com/c/quora-question-pairs#evaluation (https://www.kaggle.com/c/quora-question-pairs#evaluation)

Metric(s):

- log-loss: https://www.kaggle.com/wiki/LogarithmicLoss (https://www.
- Binary Confusion Matrix

2.3 Train and Test Construction

We build train and test by randomly splitting in the ratio of 70:30 or 80:20 whatever we choose as we have sufficient points to work with.

3. Exploratory Data Analysis

```
In [4]: import numpy as np
        import pandas as pd
        import seaborn as sns
        import matplotlib.pyplot as plt
        from subprocess import check output
        %matplotlib inline
        import plotly.offline as py
        py.init notebook mode(connected=True)
        import plotly.graph objs as go
        import plotly.tools as tls
        import os
        import gc
        import re
        from nltk.corpus import stopwords
        import distance
        from nltk.stem import PorterStemmer
        from bs4 import BeautifulSoup
```

3.1 Reading data and basic stats

```
In [5]: | df = pd.read_csv("train.csv")
          print("Number of data points:",df.shape[0])
          Number of data points: 404290
In [6]: df.head()
Out[6]:
               id qid1 qid2
                                                                question1
                                                                                                              question2 is_duplicate

In [7]: df.info()
          <class 'pandas.core.frame.DataFrame'>
```

RangeIndex: 404290 entries, 0 to 404289 Data columns (total 6 columns): id 404290 non-null int64 qid1 404290 non-null int64 qid2 404290 non-null int64 question1 404289 non-null object question2 404288 non-null object is duplicate 404290 non-null int64 dtypes: int64(4), object(2) memory usage: 18.5+ MB

We are given a minimal number of data fields here, consisting of:

- id: Looks like a simple rowID
- qid{1, 2}: The unique ID of each question in the pair
- question{1, 2}: The actual textual contents of the questions.
- is duplicate: The label that we are trying to predict whether the two questions are duplicates of each other.

3.2.1 Distribution of data points among output classes

- Number of duplicate(smilar) and non-duplicate(non similar) questions

```
In [8]: df.groupby("is_duplicate")['id'].count().plot.bar()

                                                                             0
```

There are two rows with null values in question2

```
In [16]: # Filling the null values with ' '
    df = df.fillna('')
    nan_rows = df[df.isnull().any(1)]
    print (nan_rows)

Empty DataFrame
Columns: [id, qid1, qid2, question1, question2, is_duplicate]
```

3.3 Basic Feature Extraction (before cleaning)

Let us now construct a few features like:

- **freq gid1** = Frequency of gid1's
- **freq_qid2** = Frequency of qid2's
- q1len = Length of q1

Index: []

- q2len = Length of q2
- q1_n_words = Number of words in Question 1
- q2 n words = Number of words in Question 2
- word_Common = (Number of common unique words in Question 1 and Question 2)
- word Total =(Total num of words in Question 1 + Total num of words in Question 2)
- word share = (word common)/(word Total)
- freq_q1+freq_q2 = sum total of frequency of qid1 and qid2
- freq_q1-freq_q2 = absolute difference of frequency of qid1 and qid2

```
In [17]: if os.path.isfile('df fe without preprocessing train.csv'):
             df = pd.read csv("df fe without preprocessing train.csv",encoding='latin-1')
         else:
             df['freq_qid1'] = df.groupby('qid1')['qid1'].transform('count')
             df['freq qid2'] = df.groupby('qid2')['qid2'].transform('count')
             df['q1len'] = df['question1'].str.len()
             df['q2len'] = df['question2'].str.len()
             df['q1 n words'] = df['question1'].apply(lambda row: len(row.split(" ")))
             df['q2 n words'] = df['question2'].apply(lambda row: len(row.split(" ")))
             def normalized word Common(row):

3.3.1 Analysis of some of the extracted features

Number of Questions with minimum length [question2] : 24

• Here are some questions have only one single words.

```
In [18]: print ("Minimum length of the questions in question1 : " , min(df['q1_n_words']))
    print ("Minimum length of the questions in question2 : " , min(df['q2_n_words']))
    print ("Number of Questions with minimum length [question1] : ", df[df['q1_n_words']== 1].shape[0])
    print ("Number of Questions with minimum length [question2] : ", df[df['q2_n_words']== 1].shape[0])

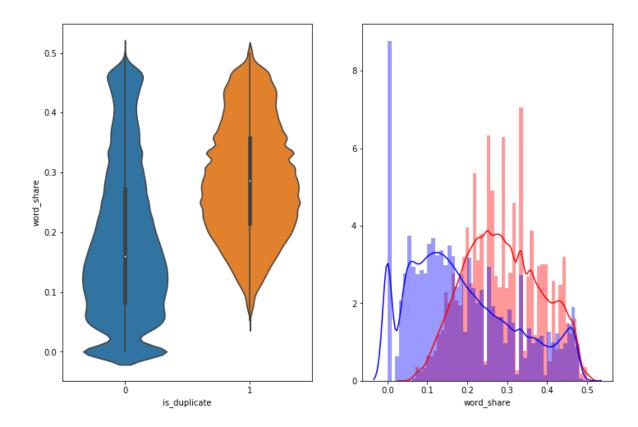

Minimum length of the questions in question1 : 1
Minimum length of the questions in question2 : 1
Number of Questions with minimum length [question1] : 67
```

3.3.1.1 Feature: word_share

In [19]: plt.figure(figsize=(12, 8)) plt.subplot(1,2,1) sns.violinplot(x = 'is_duplicate', y = 'word_share', data = df[0:]) plt.subplot(1,2,2) sns.distplot(df[df['is_duplicate'] == 1.0]['word_share'][0:] , label = "1", color = 'red') sns.distplot(df[df['is_duplicate'] == 0.0]['word_share'][0:] , label = "0" , color = 'blue') plt.show()

C:\Users\Himanshu Pc\Anaconda3\lib\site-packages\scipy\stats.py:1713: FutureWarning:

Using a non-tuple sequence for multidimensional indexing is deprecated; use `arr[tuple(seq)]` instead of `arr[seq]`. In the future this will be interpreted as an array index, `arr[np.array(seq)]`, which will result either in an error or a different result.

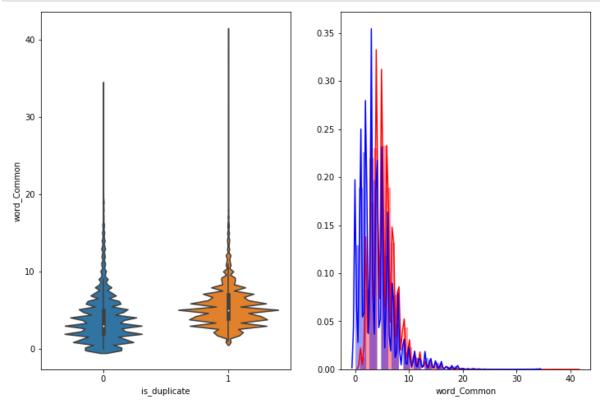

• The distributions for normalized word share have some overlap on the far right-hand side, i.e., there are quite a lot of questions with high word similarity

• The average word share and Common no. of words of qid1 and qid2 is more when they are duplicate(Similar)

3.3.1.2 Feature: word_Common

```
In [20]: plt.figure(figsize=(12, 8))
    plt.subplot(1,2,1)
    sns.violinplot(x = 'is_duplicate', y = 'word_Common', data = df[0:])

plt.subplot(1,2,2)
    sns.distplot(df[df['is_duplicate'] == 1.0]['word_Common'][0:] , label = "1", color = 'red')
    sns.distplot(df[df['is_duplicate'] == 0.0]['word_Common'][0:] , label = "0" , color = 'blue' )
    plt.show()
```

The distributions of the word Common feature in similar and non-similar questions are highly overlapping
